The Brunauer – Emmett – Teller (BET) model (Brunauer, Emmett et al., 1938) has been the most widely used method for predicting moisture sorption by solids. An important application of the BET isotherm is the surface area evaluation for solid materials. In general, the BET model describes the isotherms well up to a relative humidity of 50%, depending on the material and the type of sorption isotherm.

Brunauer – Emmett – Teller (BET) theory aims to explain the physical adsorption of gas molecules on a solid surface and serves as the basis for an important analysis technique for the measurement of the specific surface area of materials. The observations are very often referred to as physical adsorption or physisorption. In 1938, Stephen Brunauer, Paul Hugh Emmett, and Edward Teller published ...
